50 Years of <u>Molecular Cell Biology</u>

- Genes are made of DNA
 - Store digital information as sequences of 4 different nucleotides
 - Direct protein assembly through RNA and the Genetic Code
- Proteins (>10000) are made of amino acids
 - Process signals
 - Activate genes
 - Move materials
 - Catalyze reactions to produce substances
 - Control energy production and consumption
- Bootstrapping still a mystery
 - DNA, RNA, proteines, membranes are today interdependent. Not clear who came first
 - Separation of tasks happened a long time ago
 - Not understood, not essential

Towards <u>Systems Biology</u>

- Biologists now understand many of the cellular components
 - A whole team of biologists will typically study a single protein for years
 - When each component and each reaction is understood, the system is understood (?)
- But this has not led to understand how "the system" works
 - Behavior comes from complex chains of interactions between components
 - Predictive biology and pharmacology still rare
 - Synthetic biology still unreliable
- New approach: try to understand "the system"
 - Experimentally: massive data gathering and data mining (e.g. Genome projects)
 - Conceptually: modeling and analyzing networks (i.e. interactions) of components
- What kind of a system?
 - Just beyond the basic chemistry of energy and materials processing...
 - Built right out of digital information (DNA)
 - Based on information processing for both survival and evolution
- Can we fix it when it breaks?
 - The question really becomes: How is information structured and processed?

Structural Architecture

(10~100 trillion in human body)

Membranes everywhere

Functional Architecture

1. The Protein Machine

- Complex folded-up shapes that:
 - Fit together, dock, undock.
 - Excite/unexcite, warp each other.
 - Bring together, catalyze, transform materials.
 - Form complex aggregates and networks.

- Mapping out such networks:
 - In principle, it's "just" a very large set of chemical equations.
 - Notations have been developed to summarize and abstract.

An actual molecular interaction network. (Nodes are distinct protein kinds, arcs mean that two kinds of proteins interact.)

Very close to

the atoms.

Triose Phosphate Isomerase

Some Allosteric Switches

Domain architecture and autoinhibitory interactions in modular switch proteins. (a) Src family kinases contain N-terminal SH3 and SH2 domains, and a kinase domain flanked by intramolecular SH3-binding and SH2-binding sites (when the C-terminal motif tyrosine is phosphorylated by Csk). The crystal structures of several family members show that both intramolecular domain interactions function in concert to lock the kinase in an inactive conformation. Activating stimuli (red) include external SH2 or SH3 ligands. After initial activation, the kinase is maintained in an active state by autophosphorylation of its activation loop. (b) SHP-2 phosphatase contains two SH2 domains and a phosphatase domain. The crystal structure of the phosphatase

shows that the N-terminal SH2 domain participates in an autoinhibitory interaction that directly blocks the phosphatase active site. Binding of external SH2 ligands activates by disrupting the autoinhibitory interaction. (c) N-WASP contains an Enabled VASP homology 1 (EVH1) domain, a B motif, a GBD, a proline-rich segment (pro) and an output region (VCA) that alone binds the Arp2/3 complex and stimulates its actin nucleation activity. The B and GBD motifs are required to repress activity and, by current models, are thought to participate in intracomplex interactions (only the structure of the GBD intramolecular complex for WASP is known). GTP-bound Cdc42 and PIP₂ synergistically activate N-WASP.

that deactivates a protein.

Humans have the same number of modular protein domains (building blocks) as worms, but twice the number of multi-domain proteins.

MIM: Molecular Interaction Maps (Kohn)

() -	↔→ ®	The double-arrowed line indicates that proteins $\bf A$ and $\bf B$ can bind to each other. The "node" placed on the line	(A) → (B)	Stoichiometric conversion of A into B.
۲	 ®	represents the A:B complex. Asymmetric binding where protein A donates a peptide that binds to a receptor site or pucket on protein B.	Cytosol nucleus	Transport of A from cytosol to nucleus. The node represents A after it has been transported into the nucleus.
	x→® ↓y	Representation of multimolecular complexes: x is A:B; y is (A:B):C. This notation is extensible to any number of components in a complex.		Formation of a homodimer. Filled circle on the right represents another copy of A . The node on the line represents the homodimer A : A .
P =	© →→⊗	Covalent modification of protein A. The single-arrowed line indicates that A can exist in a phosphorylated state. The node represents the phosphorylated species.	x z y	z is the combination of states defined by x and y . Enzymatic stimulation of a reaction.
Ph'tas	⋟ <mark>⋗</mark> ⋛	Cleavage of a covalent bond: dephosphorylation of A by a phosphatase.		General symbol for stimulation. A bar behind the arrowhead signifies necessity. General symbol for inhibition.
\subset	€ €	Proteolytic cleavage at a specific site within a protein.	> 	Shorthand symbol for transcriptional activation. Shorthand symbol for transcriptional inhibition.
			Ø	Degradation products Taken from

The p53-Mdm2 and DNA Repair Regulatory Network

The Protein Machine "Instruction Set"

Switching of accessible switches.

- May cause other switches and

binding sites to become (in)accessible.

- May be triggered or inhibited by nearby specific proteins in specific states.

Binding on accessible sites.

- May cause other switches and

binding sites to become (in)accessible.

- May be triggered or inhibited by nearby specific proteins in specific states.

Notations for the Protein Machine

- Stochastic π -Calculus
 - Priami (following Hillston's PEPA) formalizes a stochastic version of p-calculus where channels have communication *rates*.
- BioSPi
 - Regev-Shapiro-Silverman propose modeling chemical interactions (exchange of electrons and small molecules) as "communication".
 - Standard stochastic simulation algorithms (Gillespie) can be used to run in-silico experiments.
 - Complex formation is encoded via p-restriction.
- PEPA
 - Calder Gilmore and Hillston model the ERK pathway.
- k-calculus
 - Danos and Laneve (following Kitano's BioCalculus) define a calculus where complex formation is primitive.
- (Stochastic) Petri Nets
 - S.Reddy'94 modeling pathways.
 - Srivastava Perterson and Bentley analyze and simulate E.coli stress response circuit.

- Bio State Charts
 - Harel uses State Charts to model biological interactions via a semi-graphical FSM notation.
- Pathway Logic
 - Talcott-Eker-Knapp-Lincoln use term-rewriting.
- BioCham
 - ChabrierRivier-Fages-Soliman use term-rewriting and CLT modelchecking.
- Kohn Diagrams, Kitano Diagrams
- SBML (Systems Biology Markup Language)
 - XML dialect for MIM's:
 - Compartments (statically nested)
 - Reagents with concentrations
 - Reactions with various rate laws
 - Read and written by many tools via the Systems Biology Workbench protocol

MAPK Cascade

Ultrasensitivity in the mitogen-activated protein cascade, Chi-Ying F. Huang and James E. Ferrell, Jr., 1996, <u>Proc. Natl. Acad. Sci. USA</u>, 93, 10078-10083.

Biochemistry: Huang and Ferrell		Proc. Natl. Acad. Sci. USA 93 (1996)								
Table 2. Predicted Hill coefficients	sumed K _m values									
	Range of assumed K_m	Range of effective Hill coefficients (nH) predicted for								
Reaction	values	MAPKKK	MAPKK	MAPK						
1. MAPKKK \rightarrow MAPKKK*	60–1500 nM	1.0	1.7	4.9						
2. MAPKKK* \rightarrow MAPKKK	60 1500 nM	1.0	1.7	4.9						
3. MAPKK → MAPKK-P	60–1500 nM	1.0	1.3-2.3	4.0 - 5.1						
4. MAPKK-P \rightarrow MAPKK	60–1500 nM	1.0	1.5-1.9	3.6 - 6.7						
5. MAPKK-P \rightarrow MAPKK-PP	60–1500 nM	1.0	1.3-2.4	3.8-5.2						
6. MAPKK-PP \rightarrow MAPKK-P	60–1500 nM	1.0	1.7 - 1.8	4.1-6.4						
7. MAPK \rightarrow MAPK-P	60–1500 nM (300 nM [†])	1.0	1.7	3.7-6.2						
8. MAPK-P \rightarrow MAPK	60-1500 nM	1.0	1.7	4.3-5.2						
9. MAPK-P \rightarrow MAPK-PP	60–1500 nM	1.0	1.7	3.4 - 6.1						
10. MAPK-PP \rightarrow MAPK-P	60–1500 nM	1.0	1.7	4.7-5.1						

The assumed K_m values for each reaction were individually varied over the ranges shown, with the assumed K_m values for the other nine reactions held constant. The effective Hill coefficients were calculated from the steepness of the predicted stimulus/response curves, as described in the text.

[†]The K_m value for reaction 7 has been measured to be 300 nM for the phosphorylation of a mammalian MAPK by a MAPKK (N. Ahn, personal communication). All of the other K_m values were initially assumed to be 300 nM as well.

МАРККК 🧲

FIG. 1. Schematic view of the MAPK cascade. Activation of MAPK depends upon the phosphorylation of two conserved sites [Thr-183 and Tyr-185 in rat p42 MAPK/Erk2 (4, 5)]. Full activation of MAPKK also requires phosphorylation of two sites [Ser-218 and Ser-222 in mouse Mek-1/MKK1 (6–10)]. Detailed mechanisms for the activation of various MAPKKs (e.g., Raf-1, B-Raf, Mos) are not yet established; here we assume that MAPKKKs are activated and inactivated by enzymes we denote E1 and E2. MAPKKK* denotes activated MAPKKK. MAPKK-P and MAPKK-PP denote singly and doubly phosphorylated MAPKK, respectively. MAPK-P and MAPK-PP denote singly and doubly phosphorylated MAPK. P'ase denotes phosphatase.

MAPK Cascade Simulation in SPiM

All coefficients 1.0 !!! 100×KKK, 100×KK, 100×K, 1×E2, 1×KKPse, 1×KPse.

Input is 1×E1. Output is 100×K-PP (ultrasensitivity).

MAPK Cascade Simulation in SPiM

All coefficients 1.0 !!! 100×KKK, 100×KK, 100×K, 10×E2, 10×KKPse, 10×KPse. (so 1×E1 is no longer sufficient to produce an output)

2. The Gene Machine

Pretty far from the atoms.

The "Central Dogma" of Molecular Biology

DNA Tutorial

The Gene Machine "Instruction Set"

cf. Hybrid Petri Nets [Matsuno, Doi, Nagasaki, Miyano]

<u>Regulation</u> of a gene (positive and negative) influences transcription. The regulatory region has precise DNA sequences, but not meant for coding proteins: meant for binding regulators.

<u>Transcription</u> produces molecules (RNA or, through RNA, proteins) that bind to regulatory region of other genes (or that are endproducts). Human (and mammalian) Genome Size 3Gbp (Giga base pairs) 750MB @ 4bp/Byte (CD) Non-repetitive: 1Gbp 250MB In genes: 320Mbp 80MB Coding: 160Mbp 40MB Protein-coding genes: 30,000-40,000 <u>M.Genitalium</u> (smallest true organism) 580,073bp 145KB (eBook) <u>E.Coli</u> (bacteria): 4Mbp 1MB (floppy) <u>Yeast</u> (eukarya): 12Mbp 3MB (MP3 song) <u>Wheat</u> 17Gbp 4.25GB (DVD)

Gene Composition

Indirect Gene Effects

No combination of standard high-throughput experiments can reconstruct an a-priori known gene/protein network [Wagner].

Fig. 1. The importance of specifiying gene activity when reconstructing genetic networks. (a) A hypothetical biochemical pathway involving two transcription factors, a protein kinase, and a protein phosphatase, as well as the genes encoding them. See text for details. (b) Shown is a list of perturbation effects for each of the five genes in (a), when perturbing individual genes by deleting them, and when using mRNA expression level as an indicator of gene activity. The left-most symbol in each line stands for the perturbed gene. To the right of each colon is a list of genes whose activity is affected by the perturbation. (c) Analogous to (b) but for a different notion of gene activity (phosphorylation state).

One of many bistable switches that cannot be described by pure gene regulatory networks [Francois & Hakim].

(structural, catalytic,

signaling, regulatory)

RNA is not just an intermediary; it can:

- Fold-up like a protein
- Act like an enzyme
- Regulate other transcribed RNA
- Direct protein editing

- ...

97-98% of the transcriptional output of the human genome is non-protein-coding RNA.

(various functions)

30-40,000 "protein genes" (1.5% of genome) 60-100,000 "transcription units" (>30% of genome is transcribed)

Taken from

John Mattick

Structure of a Regulatory Region

C Module A functions:

Vegetal plate expression in early development:

Synergism with modules B and G enhancing endoderm expression in later development:

Repression in ectoderm (modules E and F) and skeletogenic mesenchyme (module DC):

Fig. 1. Endo16 cis-regulatory system and interactive roles of module A. (A) Diversity of protein binding sites and organization into modular subregions [modified from (7)]. Specific DNA binding sites are indicated as red blocks; modular subregions are denoted by letters G to A (Bp, basal promoter). Proteins binding at the target sites considered in this work are indicated: Otx, SpOtx-1 (12); SpGCF1 (14); the proteins CG, Z, and P, which are not yet cloned; and protein C [a CREB family protein (18)] in subregion F. Proteins for which sites occur in multiple regions of the DNA sequence (indicated by the black line) are shown beneath. (B) Sequence of module A and location of protein binding sites. Sites are indicated in the same colors as in (A). A fragment containing CG₃ and CG₄ sites as well as Bp has no endoderm-

specific activity and services other upstream cis-regulatory systems promiscuously; similarly, the *Endo16* cis-regulatory system functions specifically with heterologous promoters substituted for Bp (*5*, *8*, *19*). Boxed sequences indicate conserved core elements of the target sites (*7*, *12*, *14*), not the complete target site sequences. (**C**) Integrative and interactive functions of module A (*5*, *8*). Module A communicates the output of all upstream modules to the basal transcription apparatus. It also initiates endoderm expression, increases the output of modules B and G, and is required for functions of the upstream modules F, E, and DC. These functions are repression of expression in nonendodermal domains and enhancement of expression in response to LiCl.

NetBuilder

The Programming Model

- Strange facts about genetic networks:
 - Not an operator algebra. The output of each gate is fixed and pre-determined; it is never a function of the input!
 - Not term-rewriting, nor Petri nets. Inhibition is widespread.
 - Not Communicating Sequential Processes. Feedback is widespread: asynchronous communication needed to avoid immediate self-deadlocks. Even the simplest gates cannot be modeled as a single synchronous automata.
 - Not Message-Passing between genes. Messages themselves have behavior (e.g., they stochastically decay and combine), hence messages are processes as well.
 - Not Data-Flow. Any attempt to use data-flow-style modeling seems doomed because of widespread loops that lead to deadlocks or unbounded queues.
- How can it possibly work?
 - Stochastic broadcasting. The apparently crude idea of broadcasting a whole bunch of asynchronous decaying messages to activate a future gate, means there are never any "pipeline full" deadlocks, even in presence of abundant feedback loops.
 - Stochastic degradation. Degradation is fundamental for system stability, and at the same time can lead to sudden instability and detection of concentration levels.

Notations for the Gene Machine

- Many of the same techniques as for the Protein Machine apply.
 - Process Calculi, Petri Nets, Term-Rewriting Systems...
- But the "programming model" is different.
 - Asynchronous stochastic control.
 - Biologically poorly understood.
 - Network "motifs" are being analyzed.

- Specific techniques:
 - Hybrid Petri Nets
 - [Matsuno, Doi, Nagasaki, Miyano] Gene Regulation
 - Genomic Object Net www.genomicobject.net
- Gene Regulation Diagrams
- Mixed Gene-Protein Diagrams

Gene Gates and Circuits

A gene gate

Notations for the Membrane Machine

- "Snapshot" diagrams
 - In biology literature.
- P-Systems
 - G.Paun uses ideas from the theory of grammars and formal languages to model "Membrane Computing" (book 2002).

http://psystems.disco.unimib.it/.

• BioAmbients

- An extension of BioSPI along Ambient Calculus lines (with more bio-relevant mobility primitives) to model dynamic compartments.
- Brane Calculi
 - Computation on the membrane...

Membrane Algorithms

Protein Production and Secretion

Viral Replication

Adapted from: B.Alberts et al. Molecular Biology of the Cell third edition p.279.

N.B. Restriction (vn) could be added to both systems and branes. It usually would originate in branes, but would extrude to whole systems.

Brane Reactions (Cartoons)

Brane-Molecule Reactions (Cartoons)

With *molecule multisets* **p**,**q**:

Phago
$$\mathfrak{D}_{n}.\sigma|\sigma'(PD) \mathfrak{D} \mathfrak{D}_{n}(\rho).\tau|\tau'(QD) \rightarrow \tau|\tau'(Pd\sigma|\sigma'(PDD)QD)$$

Exo $\mathfrak{D}_{n}^{\perp}.\tau|\tau'(\mathfrak{D}_{n}.\sigma|\sigma'(PD)QD) \rightarrow P \mathfrak{D} \sigma|\sigma'|\tau|\tau'(QD)$
Pino $\mathfrak{D}(\rho).\sigma|\sigma'(PD) \rightarrow \sigma|\sigma'(Pd)PD$

N.B.: the parity of nesting of P and Q is preserved; this makes the reactions preserve bitonality.

B&R
$$p_1 \circ p_1(p_2) \Rightarrow q_1(q_2) \cdot \alpha | \sigma \mathbb{Q} p_2 \circ \mathsf{PD} \Rightarrow q_1 \circ \alpha | \sigma \mathbb{Q} q_2 \circ \mathsf{PD}$$

Ex: Autophagic Process

"On Brane" vs. "In Brane"

Awkward encoding. And all kinds of things can go wrong in the intermediate state.

- One cannot easily represent the Exo reaction in BioAmbients or any such compartment-based calculus, nor can one easily add it as a new primitive!
- But we can add BioAmbients-like In/Out out to Brane Calculi if we want to.

Abstract Machines of Systems Biology

Importance of Stochastic Effects

- A deterministic system:
 - May get "stuck in a fixpoint".
 - And hence never oscillate.
- A similar stochastic system:
 - May be "thrown off the fixpoint" by stochastic noise, entering a long orbit that will later bring it back to the fixpoint.
 - And hence oscillate.

Surprisingly enough, we

have found that parameter values that give rise to a stable steady state in the deterministic limit continue to produce reliable oscillations in the stochastic case, as shown in Fig. 5. Therefore, the presence of noise not only changes the behavior of the system by adding more disorder but can also lead to marked qualitative differences.

Mechanisms of noiseresistance in genetic oscillators Jose' M. G. Vilar, Hao Yuan Kueh, Naama Barkai, Stanislas Leibler PNAS April 30, 2002 vol. 99 no. 9 p.5991

Fig. 5. Time evolution of *R* for the deterministic Eq. [1] (a) and stochastic (b) versions of the model. The values of the parameters are as in the caption of Fig. 1, except that now we set $\delta_R = 0.05$ h⁻¹. For these parameter values, $\tau < 0$, so that the fixed point is stable.

Fig. 6. Phase portrait as in Fig. 4 but for a situation in which the system falls into the stable fixed point (R_0, C_0). The dotted arrow to the left of the fixed point illustrates a perturbation that would initiate a single sweep of the (former) oscillatory trajectory.

Scaling up to Big Systems: ODE's vs Processes

Stochastic π -calculus Executive Summary

- A process calculus:
 - The modular representation of concurrent (and stochastic) processes of all kinds.
 - Cuts down to CTMCs (Continuous Time Markov Chains) in the finite case (not always). Then, standard tools are applicable.
 - Can be given friendly automata-like scalable graphical syntax (work in progress: Andrew Phillips).
 - Is directly executable (e.g. via Gillespie).
 - Is analyzable (large body of literature, at least in the non-stochastic case).

Figure 3. Protein A molecules v.s. time in presence (left) and absence (right) of TF

A.Phillips, L.Cardelli. BioConcur'04.

Chemistry vs. π -calculus A compositional graphical representation, A process calculus (chemistry, or SBML) and the corresponding calculus. $Na + CI \rightarrow_{k1} Na^+ + CI^-$ CNa $Na^+ + Cl^- \rightarrow_{_{k2}} Na + Cl$ k1 **k**1 Na C ?r lr S 25 Reaction oriented k2 Na⁺ Cl-Interaction oriented Na⁺ Cl-The same "model" Na⁺ Maps to Maps to $Na = !r_{k1}; ?s_{k2}; Na$ k2 a CTMC a CTMC $CI = ?r_{k1}; !s_{k2}; CI$ This Petri-Net-like graphical representation Cl-

degenerates into spaghetti diagrams: precise and dynamic, but not scalable, structured, or maintainable.

A different process calculus (π)

From Reactions to ODE's

From Reactions to Processes

Stoichiometric Matrices Blow Up

- We can translate Chemistry to ODE's or Processes
 - It is standard to go from chemical equations to ODE's via a stoichiometric matrix.
 - It is similarly possible to go from chemical equations to processes via a stoichiometric matrix.
- But there is a better way:
 - Stoichiometric matrices blow-up exponentially for biochemical systems (unlike for ordinary chemical systems) because proteins have combinatorial state and complexed states are common.
 - To avoid this explosion, we should describe biochemical systems compositionally without going through a stochiometric matrix (and hence without ODE's).

Complexes: The ODE Way

The matrix is very sparse, so the corresponding ODE system is not dense. But it still has 2^n equations, one per species, plus conservation equations ([ABC]+[A_pBC]=constant, etc.).

System description is <u>exponential</u> in the number of basic components.

Stoichiometric Matrix

N	v ₁	v ₂	V ₃	v ₄	v ₅	v ₆	v ₇	v ₈	v 9	v ₁₀	v ₁₁	v ₁₂	v ₁₃	v ₁₄	v ₁₅	v ₁₆	v ₁₇	v ₁₈	v ₁₉	v ₂₀	v ₂₁	v ₂₂	V ₂₃	v ₂₄

АрВрС									- ^)												
АрВСр																								
АВрСр																								
АрВрСр																								

06-08-28

Complexes: The Process Way

When the local domain reactions are not independent, we can use lateral communication so that each component is aware of the relevant others. System description is <u>linear</u> in the number of basic components.

(Its "run-time" behavior or analysis potentially blows-up just as in the previous case.)

Conclusions

- Q: "The data are accumulating and the computers are humming, what we are lacking are the words, the grammar and the syntax of a new language..." D. Bray (TIBS 22(9):325-326, 1997)
- A: "The most advanced tools for computer process description seem to be also the best tools for the description of biomolecular systems."

E.Shapiro (Lecture Notes)
